

Project Design Phase

Problem – Solution Fit Template

Date	28 September 2026
Team ID	SWTID-2026-2670
Project Name	BlvgNest
Maximum Marks	2 Marks

Problem – Solution Fit Template

The Problem-Solution Fit connects the identified customer problem with the implemented BlvgNest solution. The mapping below uses the actual functions visible in the supplied project code.

Problem-Solution Fit Canvas

Customer / Target User	Problem / Need	BlvgNest Solution	Expected Fit
Reader	Finding relevant blvg content can be difficult.	Posts can be retrieved with search/category/tag filters through the blvg API.	Improves content discovery.
Author	Creating and managing posts requires several operations.	Protected post APIs support create, read, update, delete, likes, cover image, tags, category, excerpt and status.	Provides structured content management.
Registered User	Account actions need protected access.	JWT-based authentication protects routes and verifies the user.	Supports secure access to protected features.
Community User	Comments need controlled handling.	Users can create comments; comments begin as pending and can be approved/spam-marked/deleted by authorized roles.	Supports moderation workflow.
Admin / Editor	Users and categories require controlled management.	Role-based authorization allows admin/editor access to user listing and category/comment management; admin can update user roles.	Provides permission-based administration.
Content Creator	Writing summaries, blvgs and FAQs manually can take time.	Authenticated AI routes provide generate-blvg, summarize and FAQ functions.	Provides AI-assisted content operations.

Fit Summary

BlvgNest addresses the identified needs through separate API modules rather than one single feature. Authentication and authorization protect user actions; post, category, comment, and user modules handle management; analytics provides metrics; and AI endpoints provide additional content assistance.

Current Scope and Limitations

- The supplied code is primarily a backend/API implementation; the frontend interface is not represented in the supplied ZIP.
- The current code does not contain a payment or subscription implementation.
- The AI controller depends on the configured external AI service/API key; the exact AI provider behavior should be validated from the environment configuration before deployment.
