Project Name	BlvgNest
Maximum Marks	2 Marks

Proposed Solution Template

Project team shall fill the following information in the proposed solution template. The descriptions below are based on the supplied BlvgNest project code.

S.Nv.	Parameter	Description
1	Problem Statement (Problem to be solved)	Blvg users need a centralized platform to create, publish, discover, and interact with blvg content. Without structured content management, authentication, moderation, and discovery features, managing blvg activities can become difficult.
2	Idea / Solution description	BlvgNest is a web-based blvg management backend/API built with Node.js and Express. It provides user registration/login with JWT authentication, role-based access, post creation and lifecycle management, search/category/tag support, likes, comments with moderation, user/category management, analytics, and authenticated AI endpoints for blvg generation, summarization, and FAQ assistance.
3	Novelty / Uniqueness	The project combines standard blvg management functions with authenticated AI assistance. The same backend provides content management, engagement, moderation, analytics, and AI-related API endpoints with role-based authorization.
4	Social Impact / Customer Satisfaction	BlvgNest can make publishing and consuming blvg content more organized. Readers can discover posts and interact through likes/comments, while authors and administrators can manage content and moderation through structured APIs.
5	Business Model (Revenue Model)	The supplied code does not define a payment or subscription module. A possible future revenue model could be introduced through premium AI features, subscriptions, or platform services, but these are not implemented in the current project.
6	Scalability of the Solution	The backend is organized into controllers, routes, models, middleware, and utilities, making features modular. MongoDB/Mongoose supports structured data storage, while separate API routes allow additional frontend clients and future modules to be added.

Project evidence used: authentication, role authorization, blvg, category, comment, user, analytics, and AI route/controller modules in the supplied BlvgNest code.
